LOSTLINK

Web-Based Campus Lost and Found Management System

1. Project Title

LostLink – Web-Based Campus Lost and Found Management System

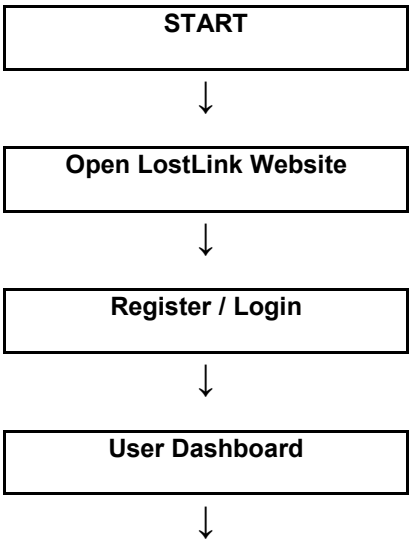

2. Problem Statement

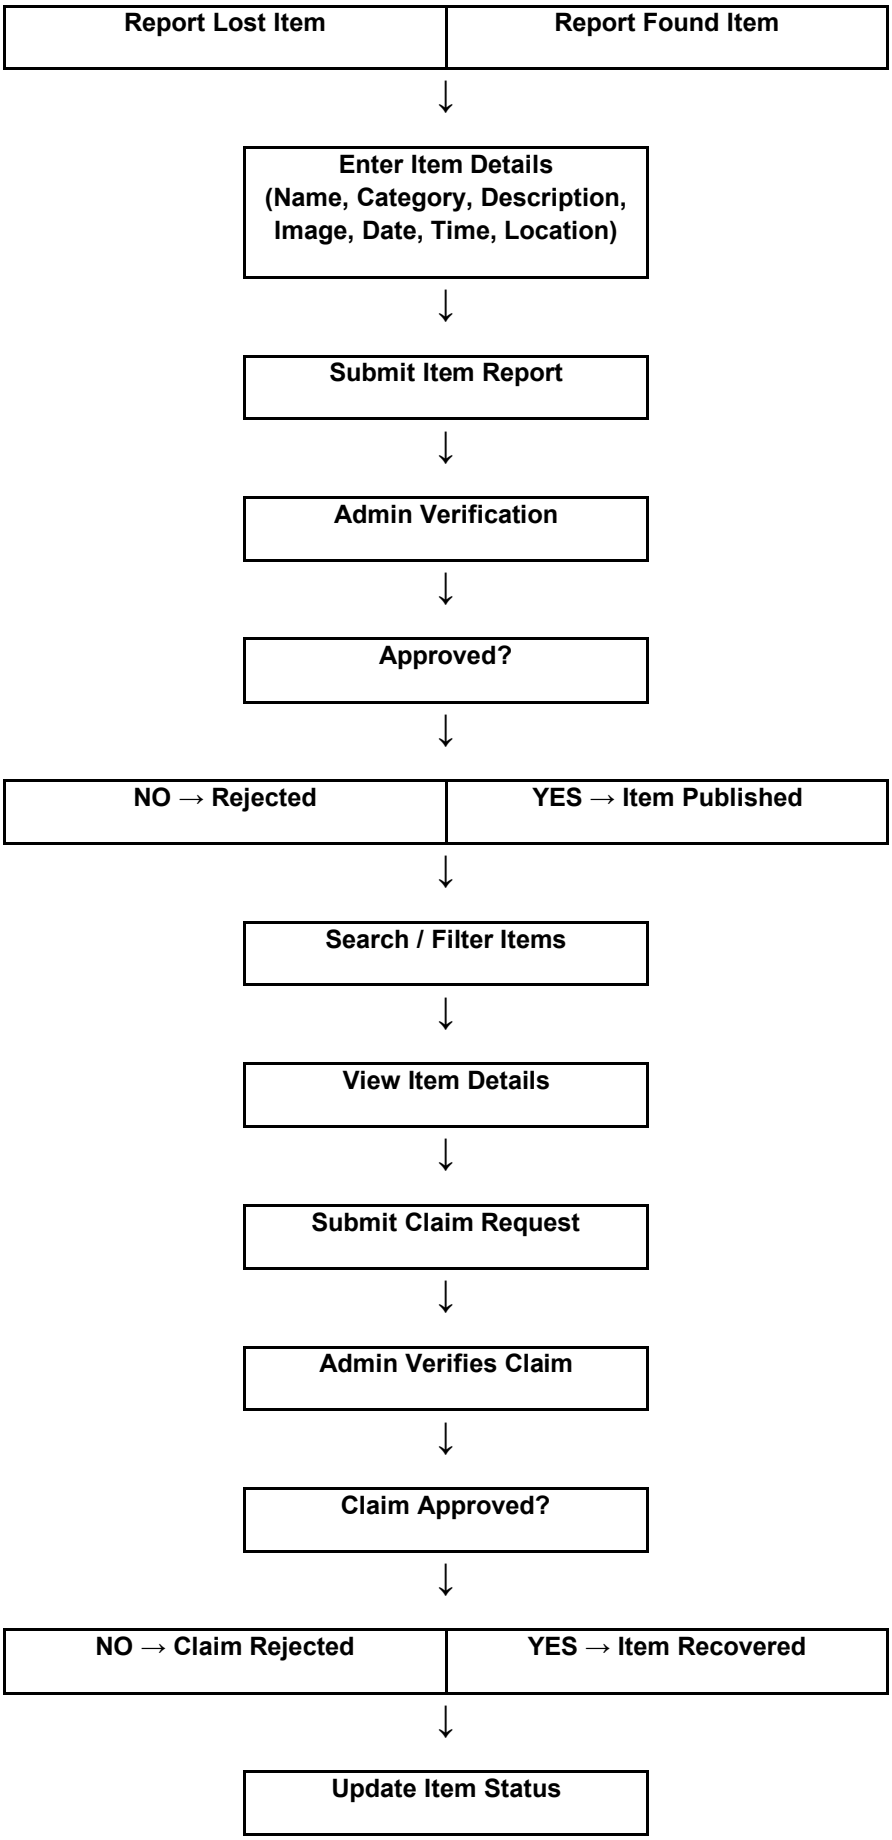

In a college campus, students and staff may frequently lose personal belongings such as ID cards, books, wallets, keys, electronic devices, and other items. The existing process of reporting and recovering lost items is often informal and depends on word-of-mouth, notice boards, or manual communication. This makes it difficult to search for matching items, verify ownership, track claims, and maintain proper records. Therefore, there is a need for a centralized web-based system that can organize lost and found item reports and make the recovery process faster, easier, and more systematic.

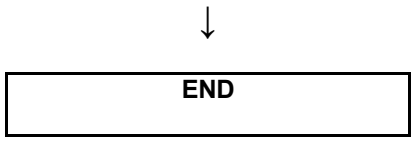

3. Abstract

LostLink is a web-based application designed to provide a centralized platform for managing lost and found items within a college campus. Students and staff can register and log in to report lost or found items by entering details such as item name, category, description, image, date, time, and location. Users can search and filter available reports to identify possible matches and submit claim requests for items they believe belong to them. The system also provides status tracking and notifications to keep users updated. An administrator can verify item reports and claims, manage users, and monitor the system through an admin dashboard. LostLink aims to replace the traditional manual lost-and-found process with an organized, accessible, and efficient digital solution.
